

Features

- Voltage noise of only 1.9nV/√Hz
- Current noise of only 1.2pA/√Hz
- Bandwidth (-3dB) of 115MHz @ $A_V = +2$
- Gain-of-2 stable
- Just 4.8mA per amplifier
- 8-pin MSOP package
- ±2.5V to ±12V operation

Applications

- ADSL receivers
- HDSLII receivers
- Ultrasound input amplifiers
- Wideband instrumentation
- Communications equipment
- AGC & PLL active filters
- Wideband sensors

General Description

The EL2227C is a dual, low-noise amplifier, ideally suited to line receiving applications in ADSL and HDSLII designs. With low noise specification of just 1.9nV/√Hz and 1.2pA/√Hz, the EL2227C is perfect for the detection of very low amplitude signals.

The EL2227C features a -3dB bandwidth of 115MHz and is gain-of-2 stable. The EL2227C also affords minimal power dissipation with a supply current of just 4.8mA per amplifier. The amplifier can be powered from supplies ranging from ±2.5V to ±12V.

The EL2227C is available in a space-saving 8-pin MSOP package as well as the industry-standard 8-pin SO. It can operate over the -40°C to +85°C temperature range.

Current revisions, if any, to these specifications are maintained at the factory and are available upon your request. We recommend checking the revision level before finalization of your design documentation.

EL2227C

Dual Very Low Noise Amplifier

Absolute Maximum Ratings (T_A = 25°C)

Values beyond absolute maximum ratings can cause the device to be prematurely damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied

Supply Voltage between V _{S+} and V _{S-}	28V
Input Voltage	V _{S-} - 0.3V, V _{S+} + 0.3V
Maximum Continuous Output Current	40mA

Maximum Die Temperature	150°C
Storage Temperature	-65°C to +150°C
Operating Temperature	-40°C to +85°C
Power Dissipation	See Curves
ESD Voltage	2kV

Important Note:

All parameters having Min/Max specifications are guaranteed. Typ values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore: T_J = T_C = T_A.

Electrical Characteristics

V_{S+} = +12V, V_{S-} = -12V, R_L = 500Ω and C_L = 3pF to 0V, R_F = R_G = 620Ω, and T_A = 25°C unless otherwise specified.

EL2227C

Dual Very Low Noise Amplifier

Applications Information

Product Description

The EL2227C is a dual voltage feedback operational amplifier designed especially for DMT ADSL and other applications requiring very low voltage and current noise. It also features low distortion while drawing moderately low supply current and is built on Elantec's proprietary high-speed complementary bipolar process. The EL2227C use a classical voltage-feedback topology which allows them to be used in a variety of applications where current-feedback amplifiers are not appropriate because of restrictions placed upon the feedback element used with the amplifier. The conventional topology of the EL2227C allows, for example, a capacitor to be placed in the feedback path, making it an excellent

choice for applications such as active filters, sample-and-holds, or integrators.

ADSL CPE Applications

The low noise EL2227C amplifier is specifically designed for the dual differential receiver amplifier function with ADSL transceiver hybrids as well as other low-noise amplifier applications. A typical ADSL CPE line interface circuit is shown in Figure 1. The EL2227C is used in receiving DMT down stream signal. With careful transceiver hybrid design and the EL2227C 1.9nV/ $\sqrt{\text{Hz}}$ voltage noise and 1.2pA/ $\sqrt{\text{Hz}}$ current noise performance, -140dBm/Hz system background noise performance can be easily achieved.

Figure 1. Typical Line Interface Connection

Disable Function

The EL2227C is in the standard dual amplifier package without the enable/disable function. A simple way to implement the enable/disable function is depicted below. When disabled, both the positive and negative supply voltages are disconnected (see Figure 2 below.)

Power Dissipation

With the wide power supply range and large output drive capability of the EL2227C, it is possible to exceed the 150°C maximum junction temperatures under certain load and power-supply conditions. It is therefore important to calculate the maximum junction temperature (T_{JMAX}) for all applications to determine if power supply voltages, load conditions, or package type need to be modified for the EL2227C to remain in the safe operating area. These parameters are related as follows:

$$T_{JMAX} = T_{MAX} + (\theta_{JA} \times PD_{MAXTOTAL})$$

where:

$PD_{MAXTOTAL}$ is the sum of the maximum power dissipation of each amplifier in the package (PD_{MAX})

PD_{MAX} for each amplifier can be calculated as follows:

$$PD_{MAX} = 2 \times V_S \times I_{SMAX} + (V_S - V_{OUTMAX}) \times \frac{V_{OUTMAX}}{R_L}$$

where:

T_{MAX} = Maximum Ambient Temperature

θ_{JA} = Thermal Resistance of the Package

PD_{MAX} = Maximum Power Dissipation of 1 Amplifier

V_S = Supply Voltage

I_{MAX} = Maximum Supply Current of 1 Amplifier

V_{OUTMAX} = Maximum Output Voltage Swing of the Application

R_L = Load Resistance

To serve as a guide for the user, we can calculate maximum allowable supply voltages for the example of the video cable-driver below since we know that $T_{JMAX} = 150^\circ\text{C}$, $T_{MAX} = 75^\circ\text{C}$, $I_{SMAX} = 9.5\text{mA}$, and the package θ_{JAS} are shown in Table 1. If we assume (for this example) that we are driving a back-terminated video cable, then the maximum average value (over duty-cycle) of V_{OUTMAX} is 1.4V, and $R_L = 150\Omega$, giving the results seen in Table 1.

Table 1

Part	Package	θ_{JA}	Max PD_{DISS} @ T_{MAX}	Max V_S
EL2227CS	SO8	160°C/W	0.406W @ 85°C	
EL2227CY	MSOP8	206°C/W	0.315W @ 85°C	

Single-Supply Operation

The EL2227C have been designed to have a wide input and output voltage range. This design also makes the EL2227C an excellent choice for single-supply operation. Using a single positive supply, the lower input voltage range is within 200mV of ground ($R_L = 500\Omega$), and the lower output voltage range is within 875mV of ground. Upper input voltage range reaches 3.6V, and output voltage range reaches 3.8V with a 5V supply and $R_L = 500\Omega$. This results in a 2.625V output swing on a single 5V supply. This wide output voltage range also allows single-supply operation with a supply voltage as high as 28V.

Gain-Bandwidth Product and the -3dB Bandwidth

The EL2227C have a gain-bandwidth product of 137MHz while using only 5mA of supply current per amplifier. For gains greater than 2, their closed-loop -3dB bandwidth is approximately equal to the gain-

EL2227C

Dual Very Low Noise Amplifier

bandwidth product divided by the noise gain of the circuit. For gains less than 2, higher-order poles in the amplifiers' transfer function contribute to even higher closed loop bandwidths. For example, the EL2227C have a -3dB bandwidth of 115MHz at a gain of +2, dropping to 28MHz at a gain of +5. It is important to note that the EL2227C have been designed so that this "extra" bandwidth in low-gain applications does not come at the expense of stability. As seen in the typical performance curves, the EL2227C in a gain of +2 only exhibit 0.5dB of peaking with a 1000 Ω load.

Output Drive Capability

The EL2227C have been designed to drive low impedance loads. They can easily drive 6V_{pp} into a 500 Ω load. This high output drive capability makes the EL2227C an ideal choice for RF, IF and video applications.

Printed-Circuit Layout

The EL2227C are well behaved, and easy to apply in most applications. However, a few simple techniques will help assure rapid, high quality results. As with any high-frequency device, good PCB layout is necessary for optimum performance. Ground-plane construction is highly recommended, as is good power supply bypassing. A 0.1 μ F ceramic capacitor is recommended for bypassing both supplies. Lead lengths should be as short as possible, and bypass capacitors should be as close to the device pins as possible. For good AC performance, parasitic capacitances should be kept to a minimum at both inputs and at the output. Resistor values should be kept under 5k Ω because of the RC time constants associated with the parasitic capacitance. Metal-film and carbon resistors are both acceptable, use of wire-wound resistors is not recommended because of their parasitic inductance. Similarly, capacitors should be low-inductance for best performance.
