DM74LS299 8-Input Universal Shift/Storage Register with **Common Parallel I/O Pins**

General Description

The DM74LS299 is an 8-bit universal shift/storage register with 3-STATE outputs. Four modes of operation are possible: hold (store), shift left, shift right and load data. The parallel load inputs and flip-flop outputs are multiplexed to reduce the total number of package pins. Separate outputs are provided for flip-flops Q0 and Q7 to allow easy cascading. A separate active LOW Master Reset is used to reset the register.

Features

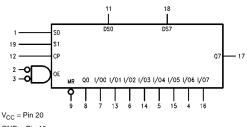

- Common I/O for reduced pin count
- Four operation modes: shift left, shift right, load and store
- Separate shift right serial input and shift left serial input for easy cascading
- 3-STATE outputs for bus oriented applications

Ordering Code:

Order Number	Package Number	Package Description
DM74LS299WM	M20B	20-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-013, 0.300 Wide
DM74LS299N	N20A	20-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300 Wide
Devices also suchable	in Trees and Deel Onesite	by several disc the sufficient the WVR to the sud-size and s

Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.

Logic Symbol

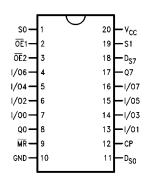

GND = Pin 10

Pin Descriptions

Pin Names	Description
CP	Clock Pulse Input (Active Rising Edge)
D _{S0}	Serial Data Input for Right Shift
D _{S7}	Serial Data Input for Left Shift
S0, S1	Mode Select Inputs
MR	Asynchronous Master Reset Input (Active LOW)
$\overline{OE}1, \overline{OE}2$	3-STATE Output Enable Inputs (Active LOW)
I/O0–I/O7	Parallel Data Inputs or 3-STATE Parallel Outputs
Q0–Q7	Serial Outputs

Connection Diagram

Functional Description

The DM74LS299 contains eight edge-triggered D-type flipflops and the interstage logic necessary to perform synchronous shift left, shift right, parallel load and hold operations. The type of operation is determined by the S0 and S1, as shown in the Mode Select Table. All flip-flop outputs are brought out through 3-STATE buffers to separate I/O pins that also serve as data inputs in the parallel load mode. Q0 and Q7 are also brought out on other pins for expansion in serial shifting of longer words.

A LOW signal on $\overline{\text{MR}}$ overrides the Select and CP inputs and resets the flip-flops. All other state changes are initiated by the rising edge of the clock. Inputs can change when the clock is in either state provided only that the recommended setup and hold times, relative to the rising edge of CP, are observed.

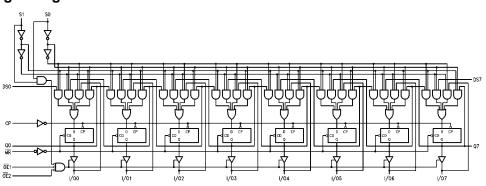

A HIGH signal on either $\overline{OE1}$ or $\overline{OE2}$ disables the 3-STATE buffers and puts the I/O pins in the high impedance state. In this condition the shift, hold, load and reset operations can still occur. The 3-STATE buffers are also disabled by HIGH signals on both SO and S1 in preparation for a parallel load operation.

Mode Select Table

Inputs				Response					
MR	S1	S0	СР	Response					
L	Х	Х	Х	Asynchronous Reset; Q0–Q7 = LOW					
н	н	Н	~	Parallel Load; I/O _n →Q _n					
н	L	Н	~	Shift Right; D _{S0} →Q0, Q0→Q1, etc.					
н	н	L	~	Shift Left; D _{S7} →Q7, Q7→Q6, etc.					
н	L	L	Х	Hold					

H = HIGH Voltage Level

L = LOW Voltage Level

Logic Diagram

Absolute Maximum Ratings(Note 1)

Supply Voltage	7V
Input Voltage	7V
Operating Free Air Temperature Range	$0^{\circ}C$ to $+70^{\circ}C$
Storage Temperature Range	$-65^\circ C$ to $+150^\circ C$

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

DM74LS299

Recommended Operating Conditions

Symbol	Parameter		Min	Nom	Max	Units
V _{CC}	Supply Voltage		4.75	5	5.25	V
V _{IH}	HIGH Level Input Voltage		2			V
