

description

The 74LS279 offers 4 basic \bar{S} - \bar{R} flip-flop latches in one 16-pin, 300-mil package. Under conventional operation, the \bar{S} - \bar{R} inputs are normally held high. When the \bar{S} input is pulsed low, the Q output will be set high. When \bar{R} is pulsed low, the Q output will be reset low. Normally, the \bar{S} - \bar{R} inputs should not be taken low simultaneously. The Q output will be unpredictable in this condition.

FUNCTION TABLE
(each latch)

INPUTS		OUTPUT
\bar{S}_1	\bar{R}	Q
H	H	Q_0
L	H	H
H	L	L
L	L	H [‡]

H = high level L = low level

[†]For latches with double S inputs:

Q_0 = the level of Q before the indicated input conditions were established.

[‡]This configuration is nonstable; that is, it may not persist when the \bar{S} and \bar{R} inputs return to their inactive (high) level.

H = both \bar{S} inputs high

L = one or both \bar{S} inputs low
